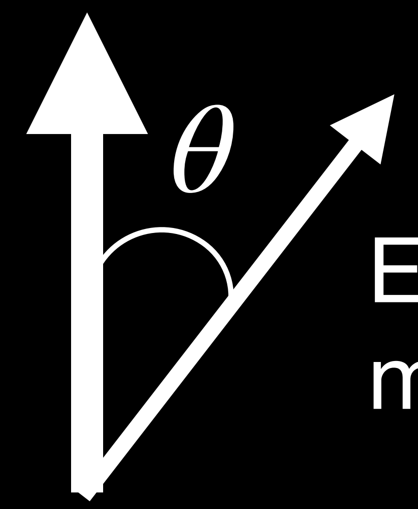
Step 6. The results

Electron's angular distribution is expected to follow:



$$W(\theta) = 1 + A \cdot P \cdot \frac{v}{c} \cdot f_{\mathrm{bs}} \cdot \cos\theta$$

$P = \dfrac{\langle I_z \rangle}{I}$ — polarization of the nuclear spin

$P \approx 0.65$ — from γ ray anisotropy

$\dfrac{v}{c} \approx 0.6$ — ratio of speed of electron to the speed of light

$f_{\mathrm{bs}} \approx \dfrac{2}{3}$ — backscattering correction

A — unknown asymmetry

Step 6. The results
