

Bits of history

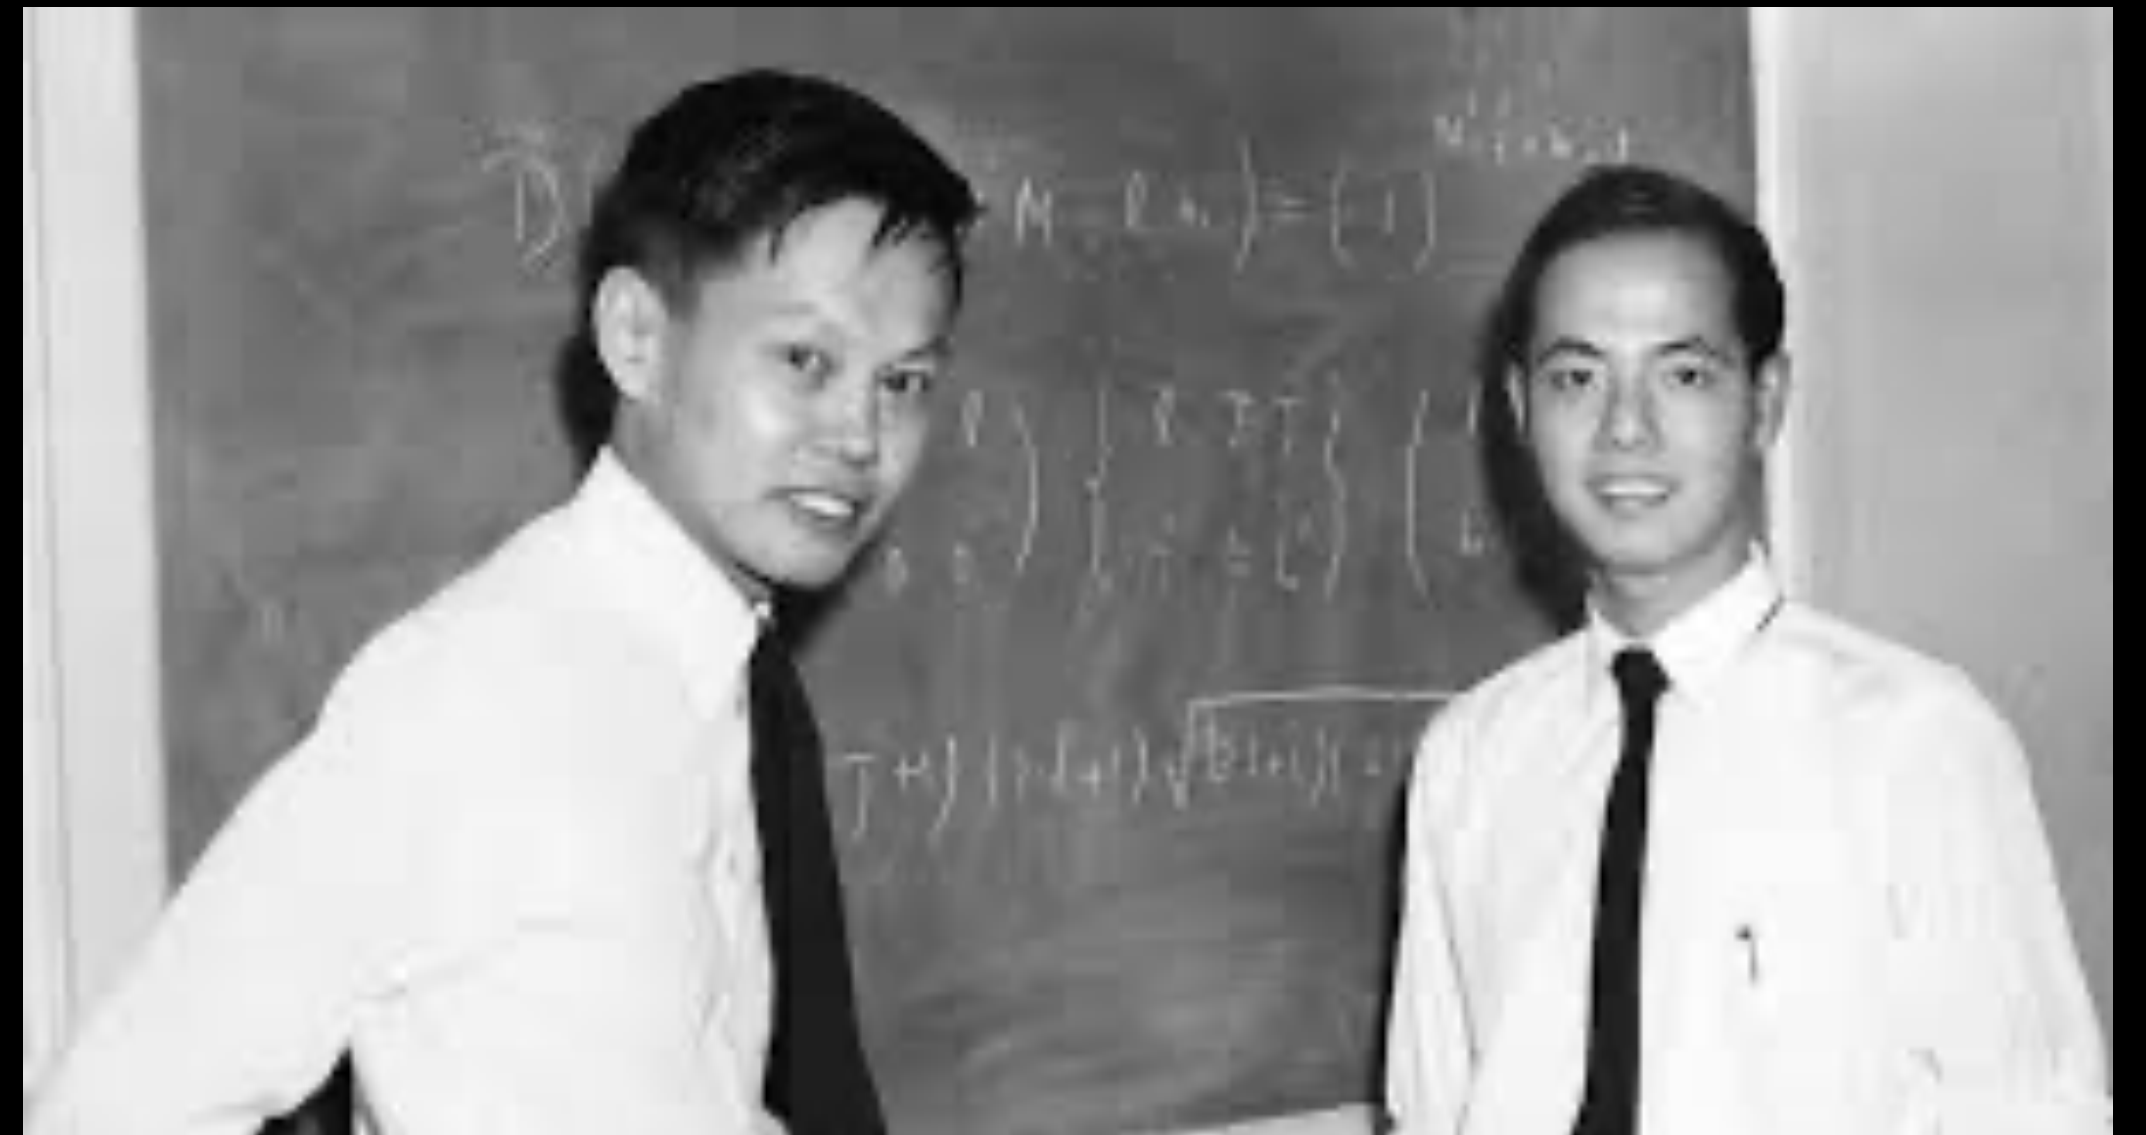

May 1956. Gell-Mann made a talk in Moscow where he suggested $\tau - \theta$ puzzle can be solved if **parity violation** is assumed in weak interactions.

Summer 1956. Li and Yang studied existing literature and realized that parity conservation was never proved for weak interactions.

They suggested how this can be verified.

Their suggestion was totally ignored

1956. Li convinced Wu to perform an experiment

Wu's Experiment
